

Ocean Perturbations Are Longwinded

*Forecast Ramifications of
Uncertainties in Idealised Transient
Scenarios*

OPAL
FRUIIS

Chris Brierley – 2u07

Tough on Uncertainty - Tough on the causes of Uncertainty

*There are 2 approaches to deal with
model errors/uncertainties.*

Attempt to remove them with better models

Trinity of Uncertainty

Initial Condition :

Atmosphere => Weather errors

Ocean => Seasonal and Annual errors

Scenario – Humanities/Economics

Model:

Multi-model ensembles

Parameter perturbations

Step 2. Stir them up.

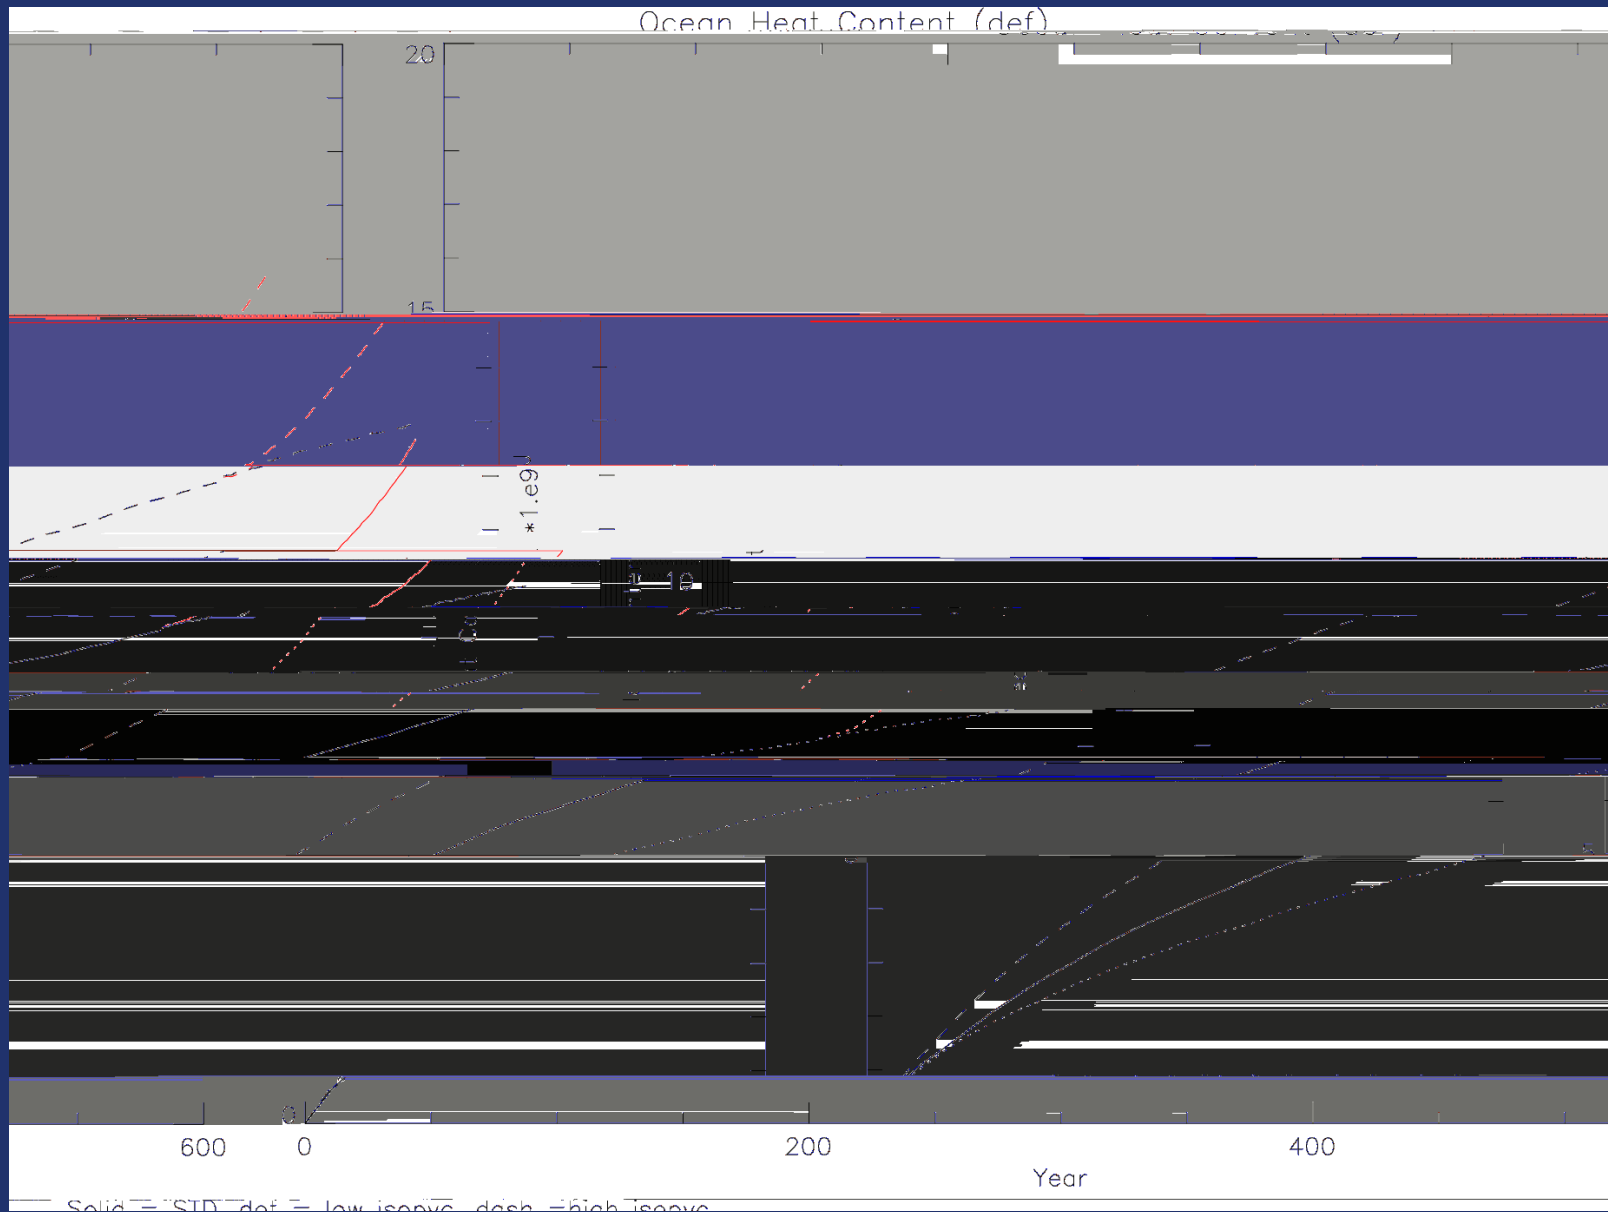

Combine the perturbations in manner of your pleasing.

- 1. All together – allow for non-linearities.*
- 2. Latin Hypercube (posh and complicated)*
- 3. Do each one singularly to really understand the physical processes.*

Step 3. Bake for ages.

Initial drift is of similar magnitude to global warming !!

How do Signal differences arise?

Are they due to differences in climatology

Change in Heat Content

Red = High, Black = Medium, Blue = Low

- This considers whole ocean and could be hiding important depth structure
